

India's Food Security: Production, Export & Population Trends

Hatif Neyaz, Namysha Shah | Executive Masters | Data Science for Decision Making

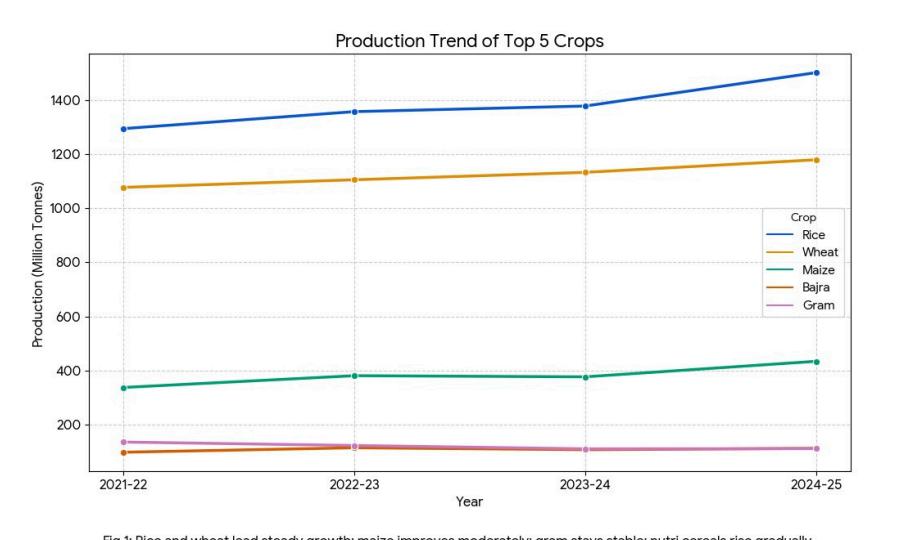

INTRODUCTION

India's agricultural sector plays a central role in ensuring national food security. With a growing population, understanding long-term trends in food grain production becomes essential for planning, policymaking, and sustainability.

This study examines multi-year production patterns of major individual crops, contrasts production with export levels, and evaluates whether food grain output is keeping pace with the country's rising population.

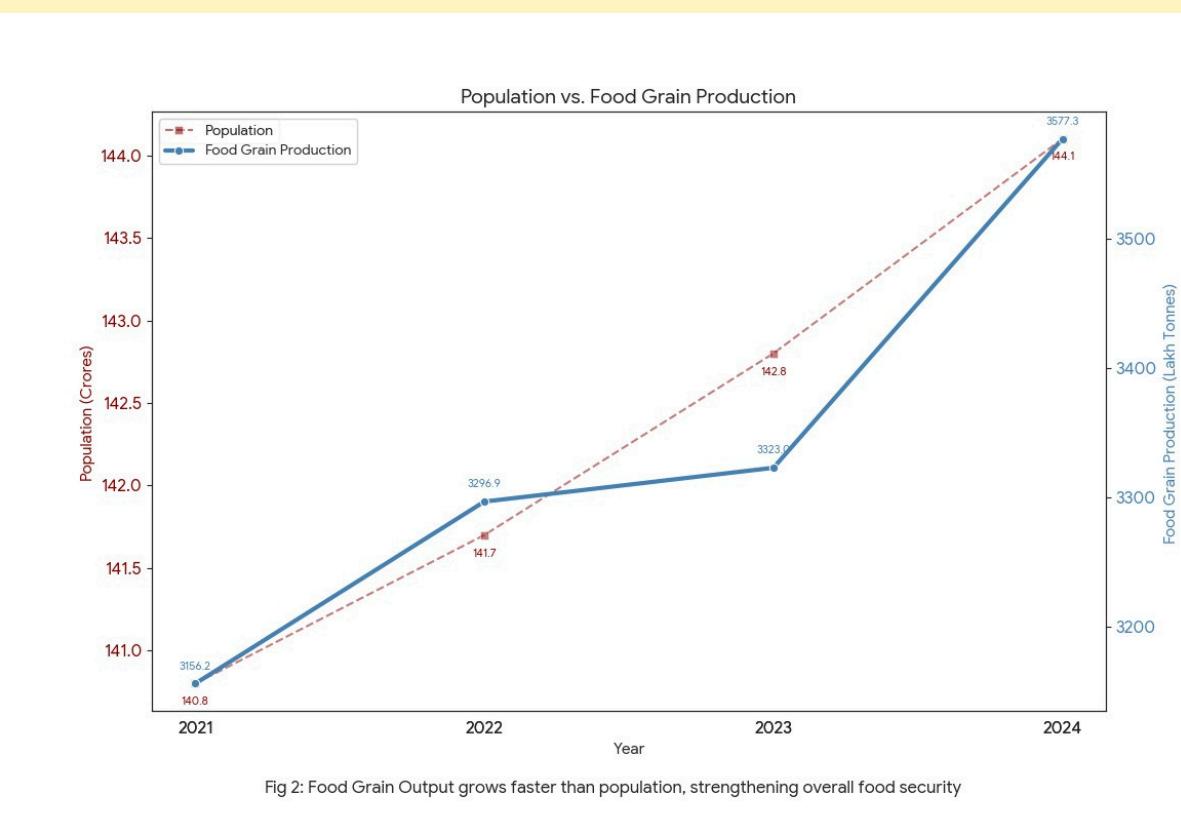

OBJECTIVE

- To analyze year-wise production trends of major food crops in India.
- To compare total crop production with export volumes across years.
- To study the relationship between India's population growth and total food grain production.

OBSERVATIONS

- Food-grain production steadily increased, mainly driven by Rice and Wheat.
- Exports dropped sharply even though production kept rising.
- Crop production is rising along with the population.

RESULTS

- Rice and Wheat showed an upward trend from 2021–2024, indicating consistent improvement.
- Exports, however, declined significantly, especially in 2024–25, despite rising production—suggesting protective export policies or domestic supply prioritization.
- The data indicates that food grain production growth outpaced population needs.

India bans wheat exports as heat wave hurts crop, domestic prices soar

CONCLUSIONS

- Positive production growth in India's key food grains strengthens domestic food availability.
- A sharp drop in exports suggests government policies are focused on internal food security.
- Continued monitoring is essential to ensure resilience against challenges like climate variability and market changes.
